

ECG Interpretation Objectives

ECG, (electrocardiogram) a simple, non-invasive procedure that can detect electrical activity problems of the heart. Creating ECG readings is straightforward, analysing them is not. This 3 hour course takes the candidates through the process step by step. At the end of the training candidates should feel confident that they can spot the normal from the abnormal and know how to respond to the recordings.

What you gain by attending the course:

- Understand the electrical conduction pathway of the heart
- List the 6 steps involved in interpreting and ECG
- Recognise sinus rhythm
- Spot the differences between Sinus Tachycardia & Ventricular Tachycardia
- Distinguish between Atrial Fibrillation & Atrial Flutter
- Identify the most common types of Heart Blocks
- Detect abnormalities of potassium levels
